

Algorithms & Analysis

Bring the Big O

How many pebbles?

HEURISTIC

Heuristics

- Not necessarily *correct* (but gets you a "*good enough*" answer)
- Advantage: *fast* (often way faster than an algorithm)
- Famous example: the Traveling Salesman Problem

Traveling Salesman Problem

- Given **N** cities with a given **cost** of traveling between each pair, what is the **cheapest** way to travel to all of them?

Arriving

Departing

	NYC	SF	CHICAGO
NYC	NA	\$250	\$120
SF	\$210	NA	\$150
CHICAGO	\$100	\$115	NA

NYC → SF → CHI	\$400
NYC → CHI → SF	\$235
SF → NYC → CHI	\$330
SF → CHI → NYC	\$250
CHI → NYC → SF	\$350
CHI → SF → NYC	\$325

Algorithms

- **Step-by-step** instructions (deterministic)
- **Complete** (gets you an answer)
- **Finite** (...given enough time)
- **Efficient** (doesn't waste time getting you the correct answer)
- **Correct** (the answer isn't just close, it is true)
- **Downside:** some problems are very **hard / slow**

Often we loosely call functions algorithms, because much of the time a function is implementing an algorithm.

ALGORITHM

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17
...etc.

How can we compare algorithms?

Algorithm Analysis: Big O Notation

- A *comparative* way to classify different algorithms
- Based on *shape* of *growth curve* (time vs input size(s))
- For *big enough* inputs
 - Might not be true when n is small, but who cares when n is small?
- Establishing an *upper bound* on the time
 - Not worse than this. Might be better, but it ain't worse!
- Including just the *highest order* term
 - In $f(n) = n^3 + 5n + 3$, only n^3 matters as n gets large
- *Ignores constants* (mostly irrelevant; $0.1 \cdot n^2$ will overtake $10 \cdot n$)

*Source: Skiena, The Algorithm Design Manual

Time Complexities (if 1 op = 1 ns)

input size n		log n	n	n·log n	n ²	2 ⁿ	n!
input size n	10	0.003 μs	0.01 μs	0.03 μs	0.1 μs	1 μs	3.63 ms
	20	0.004 μs	0.02 μs	0.09 μs	0.4 μs	1 ms	77.1 years
	30	0.005 μs	0.03 μs	0.15 μs	0.9 μs	1 sec	8.4 × 10 ¹⁵ yrs
	40	0.005 μs	0.04 μs	0.21 μs	1.6 μs	18.3 min	
	50	0.006 μs	0.05 μs	0.28 μs	2.5 μs	13 days	
	100	0.007 μs	0.10 μs	0.64 μs	10.0 μs	4 × 10 ¹³ yrs	
	1 000	0.010 μs	1.00 μs	9.97 μs	1 ms		
	10 000	0.013 μs	10.00 μs	~130.00 μs	100 ms		
	100 000	0.017 μs	100.00 μs	1.7 ms	10 sec		
	1 000 000	0.020 μs	1 ms	19.9 ms	16.7 min		
	10 000 000	0.023 μs	10 ms	230.0 ms	1.16 days		
	100 000 000	0.027 μs	100 ms	2.66 sec	115.7 days		
	1 000 000 000	0.030 μs	1 sec	29.90 sec	31.7 years		

Big O: **comparative**

- A very coarse, broad tool — big simplification
- Only useful when algorithms have *different* Big O notations
 - $O(n)$ will always beat $O(n^2)$, *for big enough n*
- If two algorithms have the same Big O, we don't know much. One might actually be quite slower than the other.

Two Linear Functions: $O(n)$

```
function findColors (arr) {  
  var colors = {  
    red: true,  
    orange: true,  
    yellow: true,  
    green: true,  
    blue: true  
  };  
  arr.forEach(function (val, i) {  
    if (colors[val]) console.log(i, val);  
  });  
}
```

```
function findColorsSlow (arr) {  
  arr.forEach(function (val, i) {  
    if (val === 'red') console.log(i, val);  
  });  
  arr.forEach(function (val, i) {  
    if (val === 'orange') console.log(i, val);  
  });  
  arr.forEach(function (val, i) {  
    if (val === 'yellow') console.log(i, val);  
  });  
  arr.forEach(function (val, i) {  
    if (val === 'green') console.log(i, val);  
  });  
  arr.forEach(function (val, i) {  
    if (val === 'blue') console.log(i, val);  
  });  
}
```

Time for
Function
to Complete

Time for
Function
to Complete

Time Complexities

Big O	Name	Think	Example
$O(1)$	<i>Constant</i>	Doesn't depend on input	get array value by index
$O(\log n)$	<i>Logarithmic</i>	Using a tree	find min element of BST
$O(n)$	<i>Linear</i>	Checking (up to) all elements	search through linked list
$O(n \cdot \log n)$	<i>Loglinear</i>	tree levels * elements	merge sort average & worst case
$O(n^2)$	<i>Quadratic</i>	Checking pairs of elements	bubble sort average & worst case
$O(2^n)$	<i>Exponential</i>	Generating all subsets	brute-force n-long binary number
$O(n!)$	<i>Factorial</i>	Generating all permutations	the Traveling Salesman
